[Algebraic geometry - Wikipedia](#)

Algebraic geometry is a branch of mathematics, classically studying zeros of multivariate polynomials. Modern algebraic geometry is based on the use of abstract algebraic techniques, mainly from commutative algebra, for solving geometrical problems about these sets of zeros. [Algebraic curve - Wikipedia](#)

In mathematics, a affine algebraic plane curve is the zero set of a polynomial in two variables. A projective algebraic plane curve is the zero set in a projective plane of a homogeneous polynomial in three variables.

For example, k is an affine algebraic group over itself with the group law being addition, and as is k^* = $k \setminus \{0\}$ with the group law multiplication. Other common examples of affine algebraic groups are $GL_n(k)$, the general linear group over k (identifying matrices with affine space) and any algebraic torus over k .

In 1900 the now common notions of abstract algebra (e.g., rings and fields) were just beginning to be developed, and Hubert's axiomatic generalization of the Euclidean plane geometry of points and lines to the general affine plane paved the way for the accompanying algebraic generalization from the real numbers to arbitrary fields. In the subsequent chapters we will follow Hubert's lead in
