Based on such differential distribution of connexin types among neural cell populations, it was suggested that gap junctions define communication compartments within the CNS, such that the astrocytic coupled compartment is separate from the oligodendrocyte and neuronal compartments (Spray and Dermietzel, 1996).

Researchers working in the field of gap junctions, the membrane structures dedicated to direct cell-cell communication, might have felt, at times, as if they are children of a lesser god.

[Connexin - Wikipedia](#)

An open gap junction, composed of six identical connexin proteins. Each of these six units is a single polypeptide which passes the membrane four times (referred to as four-pass transmembrane proteins).
