[Gap Junction - Definition, Function, Structure & Quiz ...](#)

Gap Junction Definition. Gap junctions are a type of cell junction in which adjacent cells are connected through protein channels. These channels connect the cytoplasm of each cell and allow molecules, ions, and electrical signals to pass between them.

[Gap junction - Wikipedia](#)

Gap junctions are a specialized intercellular connection between a multitude of animal cell-types. They directly connect the cytoplasm of two cells, which allows various molecules, ions and electrical impulses to directly pass through a regulated gate between cells.

[Gap Junction - an overview | ScienceDirect Topics](#)

Gap Junction. Gap junctions are a structure of six multiple protein units (connexins) that couple with an identical unit in a neighboring cell to form a channel connecting the two cytoplasm.

[Difference Between Gap Junction and Tight Junction: Gap ...](#)

There are three types of cell junction; namely, tight junctions, gap junctions, and adhering (anchoring) junctions. These junctions are important to maintain cell-to-cell communication, facilitate molecular transport among cells, make impermeable boundaries in order to prevent diffusion, and hold cells together by binding them tightly etc.

[\(PDF\) Gap Junctions: Basic Structure and Function](#)

Gap junctions allow the exchange of ions, second messengers, and small metabolites between adjacent cells and are formed by two unrelated protein families, the pannexins and connexins.

Gap Junctions - National Center for Biotechnology Information

Gap junctions are aggregates of intercellular channels that permit direct cell-cell transfer of ions and small molecules. Initially described as low-resistance ion pathways joining excitable cells (nerve and muscle), gap junctions are found joining virtually all cells in solid tissues.
