## Phospholipid - Wikipedia

Phospholipids are a class of lipids that are a major component of all cell membranes. They can form lipid bilayers because of their amphiphilic characteristic. [How Phospholipids Help Hold a Cell Together](#) Phospholipids belong to the lipid family of biological polymers. A phospholipid is composed of two fatty acids, a glycerol unit, a phosphate group, and a polar molecule. [What is a Phospholipid? - Structure, Functions & Composition](#)

[Structure of Phospholipids](#). Your body is a complicated machine, so you may be surprised to learn that important biological molecules that make up living things fall into only four main classes.

## Phospholipid | biochemistry | Britannica.com

**Phospholipid**: Phospholipid, any member of a large class of fatlike, phosphorus-containing substances that play important structural and metabolic roles in living cells.

The phospholipids, with the sphingolipids, the glycolipids, and the lipoproteins, are called complex lipids, as distinguished from the simple

## Phospholipids | definition of phospholipids by Medical ...

**phospholipids** A class of lipids containing a platform which may be glycerol or sphingosine, to which are attached one or more fatty acids and a phosphate group with an alcohol linked to it.

## Phospholipid | Definition of Phospholipid by Merriam-Webster

Note: Phospholipids typically consist of a hydrophilic polar phosphate head and a hydrophobic tail of two fatty acids. In aqueous environments, phospholipids typically form semipermeable bilayers in which the hydrophilic heads point outward and the hydrophobic tails point inward toward each other.

**What Is the Function of Phospholipids? | Reference.com**

The most important function of phospholipids is to form the phospholipid bilayer of the plasma membrane. In this bilayer, phospholipids are arranged so that their hydrophobic heads are pointing outwards and their hydrophilic tails are pointing inwards.

These criteria require (a) prolongation of 1 or more phospholipid-dependent tests beyond the upper limit of the reference interval; (b) evidence that the above prolongation is due to the presence of an inhibitor and not to a deficiency of 1 or more coagulation factors; and (c) direction of the inhibitor against negatively charged phospholipids in complex with proteins and not against a
