The definition, classification, etiology, and pathophysiology of shock are discussed in this review. The clinical presentation and diagnostic evaluation of undifferentiated shock and the evaluation of patients with specific forms of shock are discussed separately. (See [The Pathogenesis of Sepsis - PubMed Central \(PMC\)](#)) Sepsis is a serious clinical condition that represents a patient's response to a severe infection and has a very high mortality rate. Normal immune and physiologic responses eradicate pathogens, and the pathophysiology of sepsis is due to the inappropriate regulation of these normal reactions.

standing the pathophysiology of shock and guiding treatment. It is less common that the body's demand for oxygen is the driving force for the imbalance (i.e., that cardiac output is completely normal in a patient in shock). One example of this situation is overwhelming infection, in which the infection causes increased cellular metabolism (and therefore increased cellular oxygen demand)
